Chapter 5: Evaluating Environmental Partitioning and Fate: Approaches based on chemical structure

David R. Shonnard
Department of Chemical Engineering

Chapter 5: Educational goals and topics covered in this chapter

Students will:
1. become aware of the chemical and physical properties that govern a chemical's environmental partitioning and fate
2. be able to estimate properties that govern environmental partitioning and fate based on chemical structure
3. be able to perform mass balances to estimate environmental partitioning and be able to design chemical structures that have targeted properties
4. be aware of the limitations of structure-property estimation methods
Why is this important?

1. Over 10,000 chemicals are manufactured and each year 1,000 new chemicals come on the market?
2. Is the risk of manufacture of these new chemicals large or small?
3. A pre-manufacture notice (PMN) is submitted to the US EPA as part of the Toxics Substances Control Act (TSCA)
4. Methods used in Ch. 5 are used to estimate environmental fate and toxicity properties for these new chemicals.

Chapter 5: Exposure assessment

Exposure Routes
1. Inhalation
2. Ingestion
3. Dermal (skin)
Chapter 5: Chemical properties and corresponding environmental processes

Table 5.1-1 Chemical properties needed to perform environmental risk screenings

<table>
<thead>
<tr>
<th>Environmental Process</th>
<th>Relevant Properties</th>

</table>

Chapter 5: Environmental properties

Table 5.2-1 Properties that influence environmental phase partitioning

<table>
<thead>
<tr>
<th>Property</th>
<th>Definition</th>
<th>Significance in estimating environmental fate and risks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Melting point ($T_m$)</td>
<td>Temperature at which solid and liquid coexist at equilibrium</td>
<td>Sometimes used as a correlating parameter in estimating other properties for compounds that are solids at ambient or near-ambient conditions</td>
</tr>
<tr>
<td>Boiling point ($T_b$)</td>
<td>Temperature at which the vapor pressure of a compound equals atmospheric pressure; normal boiling points (temperature at which pressure equals one atmosphere) will be used in this text</td>
<td>Characterizes the partitioning between gas and liquid phases; frequently used as a correlating variable in estimating other properties</td>
</tr>
<tr>
<td>Vapor pressure ($P_{vp}$)</td>
<td>Partial pressure exerted by a vapor when the vapor is in equilibrium with its liquid</td>
<td>Characterizes the partitioning between gas and liquid phases</td>
</tr>
</tbody>
</table>
Chapter 5: Environmental properties (cont.)

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Characterizes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Henry's law constant (H)</td>
<td>Equilibrium ratio of the concentration of a compound in the gas phase to the concentration of the compound in a dilute aqueous solution (sometimes reported as atm·m³/mol; dimensionless form will be used in this text)</td>
<td>the partitioning between gas and aqueous phases</td>
</tr>
<tr>
<td>Octanol-water partition coefficient (Kₗₒ)</td>
<td>Equilibrium ratio of the concentration of a compound in octanol to the concentration of the compound in water</td>
<td>the partitioning between hydrophilic and hydrophobic phases in the environment and the human body; frequently used as a correlating variable in estimating other properties</td>
</tr>
<tr>
<td>Water solubility (S)</td>
<td>Equilibrium solubility in mol/L</td>
<td>the partitioning between hydrophilic and hydrophobic phases in the environment</td>

</thead>
<tbody>
<tr>
<td>Soil sorption coefficient (Kₛ)</td>
<td>Equilibrium ratio of the mass of a compound adsorbed per unit weight of organic carbon in a soil (in µg/g organic carbon) to the concentration of the compound in a liquid phase (in µg/ml)</td>
<td>the partitioning between solid and liquid phases in soil which in turn determines mobility in soils; frequently estimated based on octanol-water partition coefficient, and water solubility</td>
</tr>
<tr>
<td>Bioconcentration factor (BCF)</td>
<td>Ratio of a chemical concentration in the tissue of an aquatic organism to its concentration in water (reported as L/kg)</td>
<td>the magnification of concentrations through the food chain</td>
</tr>
</tbody>
</table>

Michigan Technological University
Assumption:

A molecule is composed of a collection of functional groups or molecular fragments and that each group or fragment contributes in a well-defined manner to the properties of the molecule.

Chapter 5: Property estimation methods based on chemical structure (cont.)

1. Empirical approach based on exp. data
   » Specific to chemical classes
   » Termed structure-activity relationships (SARs)

1. Approaches in Ch 5
   » Functional Groups ($K_{OW}$, $k_{OH}$, $P_{Bio}$)
   » Bond Types (H)
   » Molecular Connectivity ($K_{OC}$)
   » Linear Free Energy ($k_{Hyd}$)
Based on \( K_{OW} \), octanol-water partitioning

- BCF - bioconcentration factor
- LC50 - lethal dose 50% mortality
- \( S \) - water solubility of organic compounds
- \( K_{OC} \) - organic carbon/water partitioning

\[ \log K_{ow} = 0.229 + \sum n_i f_i + \sum n_j c_j \]

\( n = \) number of functional groups of types \( i \) or \( j \)
\( f_i = \) contribution to \( \log K_{ow} \) of group \( i \)
\( c_j = \) correction factor for functional group \( j \)
Chapter 5: Functional groups

1,1-Dichloroethylene example

the molecular structure, \( \text{CH}_2 = \text{CCl}_2 \)

- one =\( \text{CH}_2 \) group
- one =\( \text{CH}^- \) or =\( \text{C} \text{<} \) group
- two –\( \text{Cl} \) (olefinic attachment) groups

\[
\log K_{ow} = 0.229 + 0.5184 + 0.3836 + 2(0.4923) = 2.11
\]

(no correction groups)

Experimental \( \log K_{ow} = 2.13 \)

Chapter 5: Bond Types

1 H - Henry’s law constant

\( H \) - Henry’s law constant

Describes partitioning of organic pollutants between the water phase and air in the environment.

\[-\log H = \sum n_i h_i + \sum n_j c_j\]

- \( n = \) number of bonds of types \( i \) or \( j \)
- \( h_i = \) contribution to \( H \) of bond type \( i \)
- \( c_j = \) functional group correction factor
Chapter 5: Bond Types

1-propanol example

the molecular structure,

\[
\begin{array}{cccc}
    & H & H & H \\
\hline
    H & C & C & C & O & -H \\
\hline
    & H & H & H \\
\end{array}
\]

From Table 5.2-13
7 C-H bonds, 2 C-C bonds, 1 C-O bond, and 1 O-H bond

\[-\log H = 7(-0.1197) + 2(0.1163) + 1.0855 + 3.2318 = 3.7112\]  

w correction; \(-\log H = 3.7112 - 0.20 = 3.5112\)

Table 5.2-14
linear or branched alcohols

Experimental \(-\log H = 3.55\)

Chapter 5: Molecular connectivity

\[K_{OC} - \text{Organic carbon-water partition coeff.}\]

Describes partitioning of organic pollutants between the water phase and natural organic matter in soils / sediments

\[\log K_{oc} = 0.53^1\chi + 0.62 + \sum n_j P_j\]

\(^1\chi = 1\text{st order molecular connectivity index}\)
\(n_j = \text{number of groups of type } j\)
\(P_j = \text{correction factor for group } j\)
Chapter 5: Molecular connectivity

1-hexanol example

the molecular structure,  

\[
\text{CH}_3 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{CH}_2 - \text{O} - \text{H}
\]

\[\delta(1) \quad \delta(2) \quad \delta(2) \quad \delta(2) \quad \delta(2) \quad \delta(1)\] - C atom connectivity

\[
(\delta_i, \delta_j) \quad (1,2) \quad (2,2) \quad (2,2) \quad (2,2) \quad (2,1)\] - bond connectivity

\[
\chi = \sum (\delta_i \cdot \delta_j)^{0.5}
\]

\[
\chi = (1/\sqrt{2}) + (1/\sqrt{4}) + (1/\sqrt{4}) + (1/\sqrt{4}) + (1/\sqrt{2}) = 3.41
\]

\[
\log K_{oc} = 0.53 \chi + 0.62 + \sum n_j p_j
\]

\[
\log K_{oc} = 0.53 (3.41) + 0.62 + (-1.519) = 0.91
\]

Experimental \(\log K_{oc} = 1.01\)  \aliphatic alcohol

Chapter 5: Correction Factors

Chemical structure provides an incomplete description of molecular interactions leading to observable properties

Correction Factors for intermolecular forces

» Electronic interactions

» Multiple hydrogen bonding

» Substituent effects
Chapter 5: Software

EPIWIN collection of software programs - Properties covered:

1. Properties used to estimate partitioning: boiling point, vapor pressure, octanol-water partition coefficient, bioconcentration factor, Henry’s law coefficient, soil sorption

2. Properties that govern environmental fate: atmospheric lifetimes, biodegradation rates

Chapter 5: Case study 1: Environmental partitioning case study

Water Compartment Only
1 kg Hexachlorobenzene (Hx)
$10^5$ m$^3$ volume of water
$10^{-3}$ kg organic carbon / m$^3$ water
0.1 kg fish / 100 m$^3$ water

Human Exposure: Fish Ingestion
0.5 kg of fish consumed
Dose due to ingestion?
Concentration in the Fish (mg/kg)?

Mackay et al., "Illustrated Handbook of Physical-Chemical Properties and Environmental Fate for Organic Chemicals", Lewis Publishers, 1992
Chapter 5: Case study 1: Mass balance equation for Hx 118-74-1

\[ M_{\text{Hx}} = M_{\text{Hx},W} + M_{\text{Hx},S} + M_{\text{Hx},F} = V_W C_W + V_W \rho_w K_w C_W + V_W \rho_w BCF C_W \]

Chapter 5: Mass balance calculations for Hx 118-74-1

Concentration in Water

\[ C_W = \frac{M_{\text{Hx}}}{\left( V_W + V_W \rho_w K_w 10^{-3} + V_W \rho_w BCF 10^{-3} \right)} = \frac{9.92 \times 10^{-6}}{10^{-3} \text{ m}^3} = 10^{-5} \frac{\text{kg Hx}}{\text{m}^3 \text{ Water}} \]

Concentration in Fish

\[ C_F = BCF \times C_W = (5152 \frac{L}{\text{kg Fish}}) \times (10^{-5} \frac{\text{kg Hx}}{\text{m}^3 \text{ Water}}) \times (10^{-3} \frac{\text{m}^3 \text{ Water}}{L}) = 5.2 \times 10^{-5} \frac{\text{kg Hx}}{\text{kg Fish}} \]

Dose to Humans

\[ Dose = M_F \times C_F = (0.5 \text{ kg Fish})(5.2 \times 10^{-5} \frac{\text{kg Hx}}{\text{kg Fish}}) = 0.026 \text{ g Hx} \]
