

### Topics for Today:

- Course Info:
  - Web page: <https://pages.mtu.edu/~bamork/ee5220/>
  - Book, references, syllabus, more are on web page.
  - Software - Matlab. ATP/EMTP [ License - [www.emtp.org](http://www.emtp.org) ] ATP tutorials posted on our course web page
  - [EE5220-L@mtu.edu](mailto:EE5220-L@mtu.edu) (participation = min half letter grade)
- Term Project - Journal paper analysis - completed by 9am Tues Apr 9th
- Line Switching
  - Single pole tripping and reclosing
  - Secondary arc interruption
- Lightning - Ch.14
  - Basic characteristics
  - Statistical approach
- Next: insulation coordination - Chapters 15.

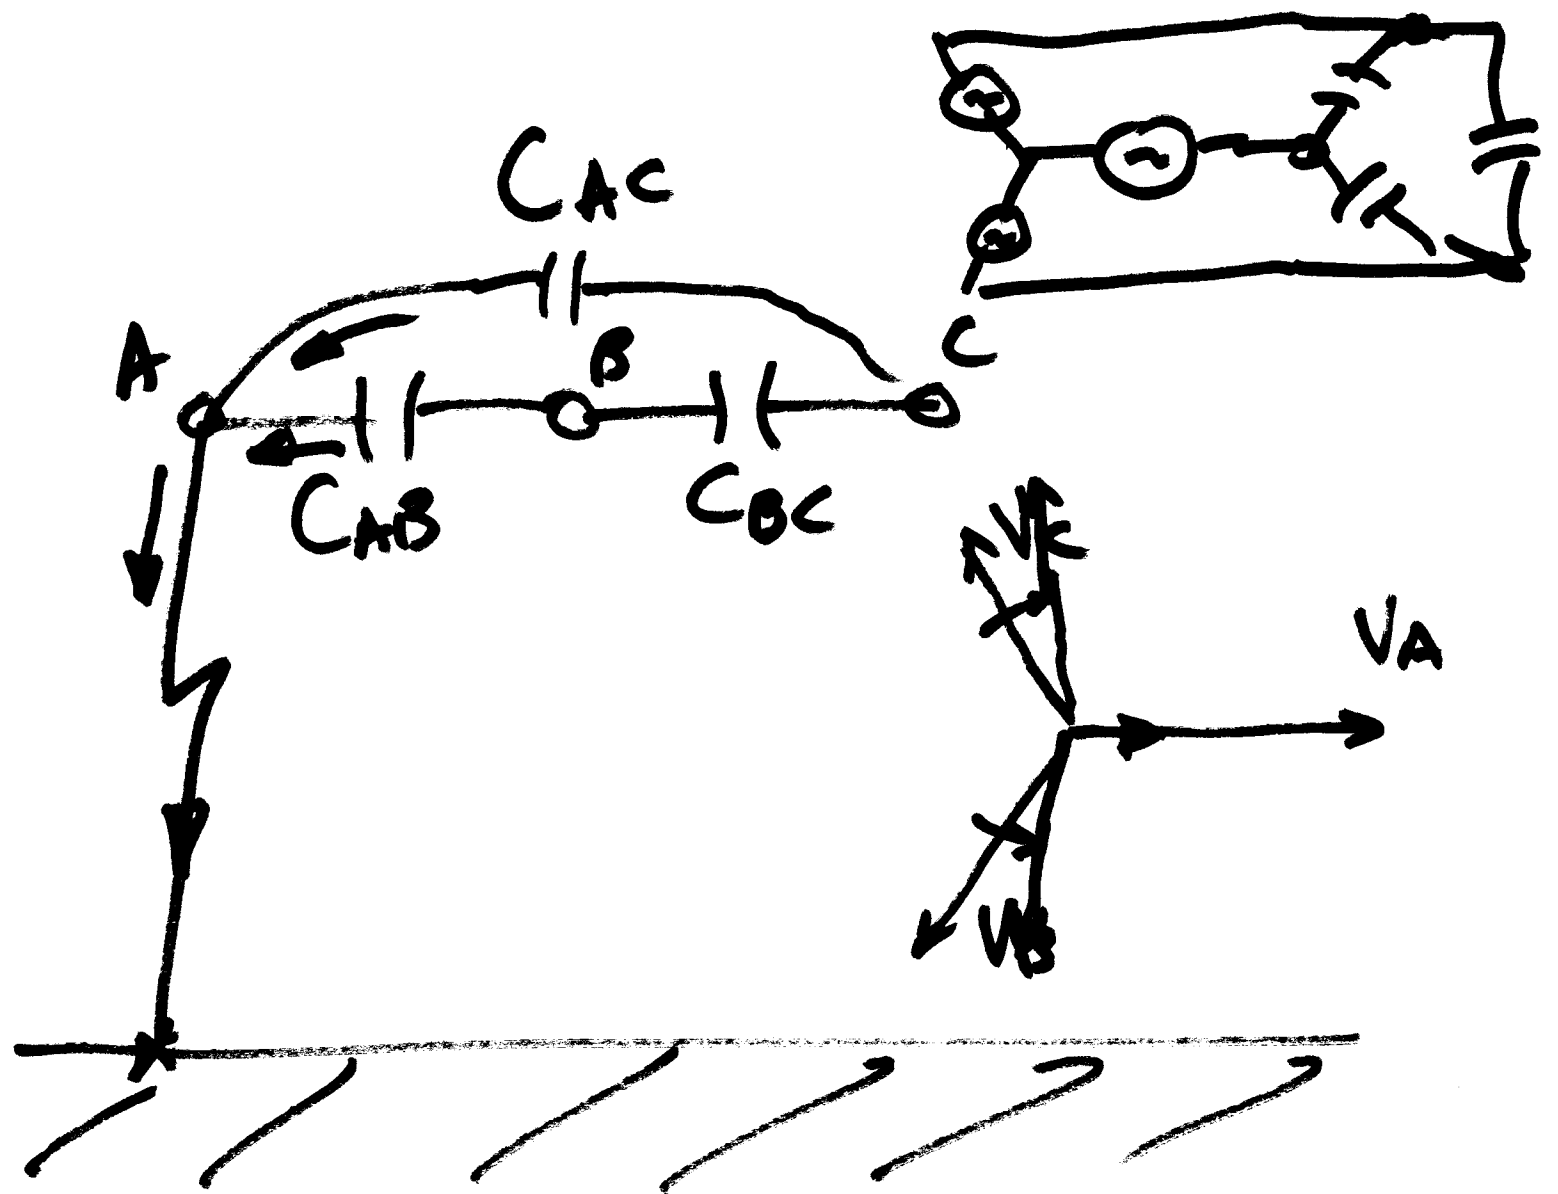

# SPT - Single-Pole Tripping

- Maintain P & Q flows thru intact phases.
- Don't "lose" system tie due to large "standing V angle" as can happen w/ 3-~~phase~~ pole trip/recl.

Capacitive coupling B-A and C-A induces voltage on A which continues to provide a "secondary arc current" (fault).

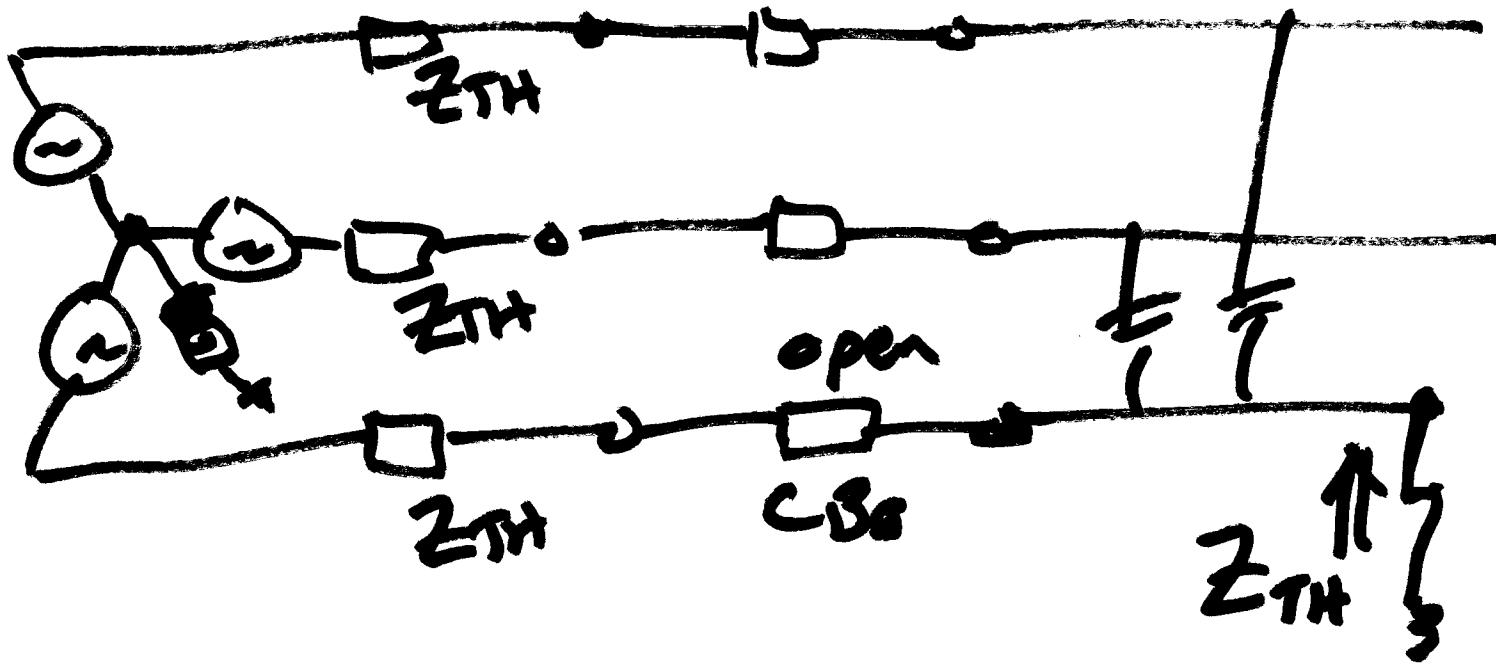

# Extinguishing Secondary Arc:

- Short Lines: self-extinguishing
- Longer Lines:
  - Grounding Switch (High-speed)
  - \_\_\_\_\_
  - Resonant Grounding

## Gnd Sw:

# Resonant Grounding

Parallel L-C impedance path  
that is resonant.

Component: SW\_STAT

Name : SW\_STAT - Statistic switch. Generalized object.  
 Card : SWITCH  
 Data : Special handling.  
 Distribution: Select uniform or gaussian distribution.  
 If IDIST=1 under ATP|Settings/Switch only uniform is possible.  
 Open/Close: Select if the switch closes or opens.  
 Current margin available for opening switch.  
 T = Average switch opening or closing time in [sec.]  
 For Slave switches this is the average delay.  
 Dev. = Standard deviation in [sec.]  
 For Slave switches this is the deviation of the delay.  
 Ie = Switch opens at a time  $T > T_{mean}$  and the current through the switch is less than  $I_e$ .  
 Select also the switch type:  
 INDEPENDENT: Two nodes  
 MASTER : Two nodes. 'TARGET' punched. Only one is allowed (not test  
 SLAVE : Four nodes. Specify node names of MASTER switch.  
 The icon and nodes of the objects adapt the switch type setting.  
 Node : SW\_F= Start node of switch.  
 SW\_T= End node of switch.  
 REF\_F= Start node of the MASTER switch  
 REF\_T= End node of the MASTER switch  
 RuleBook: VI.B.1.

Pole Span -

In probability theory, a probability density function (PDF), or density of a continuous random variable, is a function that describes the relative likelihood for this random variable to take on a given value. The probability of the random variable falling within a particular range of values is given by the integral of this variable's density over that range—that is, it is given by the area under the density function but above the horizontal axis and between the lowest and greatest values of the range. The probability density function is nonnegative everywhere, and its integral over the entire space is equal to one.

In probability theory, the normal (or Gaussian) distribution is a very common continuous probability distribution. Normal distributions are important in statistics and are often used in the natural and social sciences to represent real-valued random variables whose distributions are not known.

In probability theory and statistics, the cumulative distribution function (CDF) of a real-valued random variable  $X$ , or just distribution function of  $X$ , evaluated at  $x$ , is the probability that  $X$  will take a value less than or equal to  $x$ .
