Number Problems

- Problems where the inputs are numbers
  - Prime number problem:
    - Input: Integer  $n$
    - Yes/No Question: Is  $n$  prime?
  - Partition problem
    - Input: Set  $S$  of  $n$  numbers  $\{s_1, \dots, s_n\}$
    - Yes/No Question: Is there an  $S'$  subset of  $S$  such that the sum of numbers in  $S' =$  the sum of numbers in  $S - S'$ .
- What is the input size for these problems?

---

---

---

---

---

---

---

## PARTITION is NP-complete

- PARTITION
  - **Input:** Set  $S$  of  $n$  numbers  $\{s_1, \dots, s_n\}$
  - **Yes/No Question:**
    - Is there an  $S'$  subset of  $S$  such that the sum of numbers in  $S'$  = the sum of numbers in  $S - S'$ ?
- $3DM \leq_p \text{PARTITION}$

---

---

---

---

---

---

---

## Integer Programming (IP)

Instance: A set  $v$  of integer variables, a set of inequalities over these variables, a function  $f(v)$  to maximize, and integer  $B$ .

Question: Does there exist an assignment of integers to  $v$  such that all inequalities are true and  $f(v) \geq B$ ?

Example:

$$\begin{aligned}v_1 &\geq 1, \quad v_2 \geq 0 \\v_1 + v_2 &\leq 3 \\f(v) &= 2v_2; \quad B = 3\end{aligned}$$

5

---

---

---

---

---

---

---

## Is Integer Programming (IP) NP-Hard?

Theorem: Integer Programming is NP-Hard

Proof: By reduction from Satisfiability ( $\text{SAT} \leq_p \text{IP}$ )

- Take an instance of SAT; includes Boolean variables and clauses.
- The IP instance has twice as many variables, one for each variable and its complement, as well as the following inequalities:

$$\begin{aligned}0 &\leq v_i \leq 1 \quad \text{and} \quad 0 \leq \neg v_i \leq 1 \\1 &\leq v_i + \neg v_i \leq 1\end{aligned}$$

for each clause  $C = \{v_1, \neg v_2, \dots, v_i\} : v_1 + \neg v_2 + \dots + v_i \geq 1$

---

---

---

---

---

---

---

## Reduction

SAT is satisfiable iff the answer to the IP problem is affirmative

### 1. Left-to-Right proof:

In any SAT solution, a TRUE literal corresponds to a 1 in IP since, if the expression is SATISFIED, at least one literal per clause is TRUE, so the inequality sum is  $> 1$ .

### 2. Right-to-Left proof:

Given a solution to this IP instance, all variables will be 0 or 1. Set the literals corresponding to 1 as TRUE and 0 as FALSE. No boolean variable and its complement will both be true, so it is a legal assignment with also must satisfy the clauses.

7

---

---

---

---

---

---

---

---

## Observations

- We proved the NP-hardness of a special case of IP
- The transformation captures the essence of why IP is hard - it has nothing to do with big coefficients or big ranges on variables; restricting to 0/1 is enough. A reduction tells us a lot about a problem.
- How easy it is to show the NP membership of IP?

8

---

---

---

---

---

---

---

---

## The Subset Sum (SS) Problem

- Inputs:
  - Set  $S$  of numbers.
  - Number  $T$  called the *target*.
- Output:
  - Yes, if  $S$  has a subset  $S'$  such that:  $\sum S'(i) = T$ .
  - No, if no such subset exist.
- Brute-force solution:
  - Compute all possible subsets of  $S$  and verify

---

---

---

---

---

---

---

---

## Example

- Inputs:
  - $S = \{10, 9, 15, 22, 39, 5, 15\}$
  - $T = 42$
- Output:
  - Yes, because  $\{15, 22, 5\}$  is a subset of  $S$  and  $15 + 22 + 5 = 42$

---

---

---

---

---

---

---

## Subset Sum is NP-Complete

- Subset Sum (SS) is in NP
  - What is a certificate?
  - Verifiable in polynomial time?
- $3\text{-SAT} \leq_p \text{SS}$

---

---

---

---

---

---

---

## 3-SAT

The 3-SAT problem:

- 3-CNF formula  $\varphi$  has:
  - $k$  clauses  $C_1, C_2, \dots, C_k$
  - $n$  propositional variables  $x_1, x_2, \dots, x_n$
- $\varphi$  has the form  $\varphi = C_1 \wedge C_2 \wedge \dots \wedge C_k$ 
  - Each clause  $C_i$  has at most three variables  $C_i = l_i \vee l_j \vee l_k$ , where  $i \neq j \neq k$  and  $l_i$  is a literal denoting  $x_i$  or  $\neg x_i$
- $x_i$  and  $\neg x_i$  cannot be in the same clause
- Each variable  $x_i$  appears in at least one clause.

---

---

---

---

---

---

---

### Example of 3-CNF formula

$$\begin{aligned}\varphi &= C_1 \wedge C_2 \wedge C_3 \wedge C_4 \\ C_1 &= x_1 \vee \neg x_2 \vee \neg x_3 \\ C_2 &= \neg x_1 \vee \neg x_2 \vee \neg x_3 \\ C_3 &= \neg x_1 \vee \neg x_2 \vee x_3 \\ C_4 &= x_1 \vee x_2 \vee x_3\end{aligned}$$

---

---

---

---

---

---

---

### Polynomial Reduction from 3-SAT (3-SAT $\leq_p$ SS)

- Input: an instance of 3-SAT
- Output: an instance of SS; i.e., a set  $S$  of numbers and one target number  $T$ .
- Mapping:
  - For each variable  $x_i$ , consider two numbers  $v_i$  and  $v'_i$
  - For each clause  $C_j$ , consider two numbers  $s_j$  and  $s'_j$
  - The format of each number is  $v_1 \dots v_n C_1 \dots C_k$
  - $|S| = 2(n + k)$  numbers in base 10 each with  $(n + k)$  digits

---

---

---

---

---

---

---

### Mapping: Example

Using the same example with 3 variables  $x_1$ ,  $x_2$ ,  $x_3$  and 4 clauses  $C_1$ ,  $C_2$ ,  $C_3$ ,  $C_4$ :

$$\begin{aligned}\varphi &= C_1 \wedge C_2 \wedge C_3 \wedge C_4 \\ C_1 &= x_1 \vee \neg x_2 \vee \neg x_3 \\ C_2 &= \neg x_1 \vee \neg x_2 \vee \neg x_3 \\ C_3 &= \neg x_1 \vee \neg x_2 \vee x_3 \\ C_4 &= x_1 \vee x_2 \vee x_3\end{aligned}$$

---

---

---

---

---

---

---

Mapping Table

- Table (part 1):
- $v_i$  and  $v'_i$  comes from  $x_i$ ,  $1 \leq i \leq 3$

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$T$							
$v_1$							
$v'_1$							
$v_2$							
$v'_2$							
$v_3$							
$v'_3$							

---

---

---

---

---

---

---

Mapping Table

- Table (part 2):
- $s_j$  and  $s'_j$  comes from  $C_j$ ,  $1 \leq j \leq 4$
- Target value:
  - $T$  has 1 for each  $x_i$  and 4 for each  $C_j$

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$s_1$							
$s'_1$							
$s_2$							
$s'_2$							
$s_3$							
$s'_3$							
$s_4$							
$s'_4$							

---

---

---

---

---

---

---

Mapping Table

- Fill rows for  $v_i$  and  $v'_i$ :
  - $v_i$  and  $v'_i$  has 1 in column  $x_i$  and 0 otherwise.

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$T$	1	1	1	4	4	4	4
$v_1$	1	0	0				
$v'_1$	1	0	0				
$v_2$	0	1	0				
$v'_2$	0	1	0				
$v_3$	0	0	1				
$v'_3$	0	0	1				

---

---

---

---

---

---

---

## Mapping Table

- Corresponding to clauses:
  - $v_i$  has 1 in column  $C_j$  if  $x_i$  appears in  $C_j$ , and 0 otherwise.
  - $v'_i$  has 1 in column  $C_j$  if  $\neg x_i$  appears in  $C_j$ , and 0 otherwise.

$$C_1 = x_1 \vee \neg x_2 \vee \neg x_3$$

$$C_2 = \neg x_1 \vee \neg x_2 \vee \neg x_3$$

$$C_3 = \neg x_1 \vee \neg x_2 \vee x_3$$

$$C_4 = x_1 \vee x_2 \vee x_3$$

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$T$	1	1	1	4	4	4	4
$v_1$	1	0	0	1	0	0	1
$v'_1$	1	0	0	0	1	1	0
$v_2$	0	1	0	0	0	0	1
$v'_2$	0	1	0	1	1	1	0
$v_3$	0	0	1	0	0	1	1
$v'_3$	0	0	1	1	1	0	0

---

---

---

---

---

---

---

---

## Reduction from SAT (14/15)

- For  $s_j$  and  $s'_j$ :
- $s_j$  has 1 in column  $C_j$ , and 0 otherwise
- $s'_j$  has 2 in column  $C_j$ , and 0 otherwise

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$s_1$	0	0	0	1	0	0	0
$s'_1$	0	0	0	2	0	0	0
$s_2$	0	0	0	0	1	0	0
$s'_2$	0	0	0	0	2	0	0
$s_3$	0	0	0	0	0	1	0
$s'_3$	0	0	0	0	0	2	0
$s_4$	0	0	0	0	0	0	1
$s'_4$	0	0	0	0	0	0	2

---

---

---

---

---

---

---

---

## SS Instance: Example

- Interpret each row as a base 10 integer.
- $S = \{1001001, 1000110, 100001, 101110, 10011, 11100, 1000, 2000, 100, 200, 10, 20, 1, 2\}$ .
- $T = 1114444$ .

---

---

---

---

---

---

---

---

## Reduction Correctness

- Claim:
  - The 3-SAT formula,  $\varphi$ , is satisfiable **if and only if** there is a subset  $S' \subseteq S$  whose sum is  $T$

---

---

---

---

---

---

---

## Left-to-Right Proof

- Suppose there is an assignment to  $x_1, x_2, \dots, x_n$ , such that  $\varphi$  evaluates to true
- If  $x_i = \text{true}$ , then include  $v_i$  in  $S'$
- If  $x_i = \text{false}$ , then include  $v'_i$  in  $S'$

---

---

---

---

---

---

---

## Left-to-Right Proof: Example

- $x_1 = 0, x_2 = 0, x_3 = 1$
- $S' = \{v_1', v_2', v_3\}$
- $Z$  has the sum of the elements in  $S'$ .
- $T$  is the target.
- We need to find how to make  $Z = T$ .

$$\varphi = C_1 \wedge C_2 \wedge C_3 \wedge C_4$$

$$C_1 = x_1 \vee \neg x_2 \vee \neg x_3$$

$$C_2 = \neg x_1 \vee \neg x_2 \vee \neg x_3$$

$$C_3 = \neg x_1 \vee \neg x_2 \vee x_3$$

$$C_4 = x_1 \vee x_2 \vee x_3$$

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$v_1$	1	0	0	0	1	1	0
$v_2$	0	1	0	1	1	1	0
$v_3$	0	0	1	0	0	1	1
<b>Z</b>	1	1	1	1	2	3	1
<b>T</b>	1	1	1	4	4	4	4

---

---

---

---

---

---

---

## Left-to-Right Proof: Example

Claim:

In  $Z$ , the digits corresponding to variables are 1.

Reason:

$S^*$  includes  $v_i$  or  $v'_i$ , but not both.

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$v'_1$	1	0	0	0	1	1	0
$v'_2$	0	1	0	1	1	1	0
$v_3$	0	0	1	0	0	1	1
$Z$	1	1	1	1	2	3	1
$T$	1	1	1	4	4	4	4

---

---

---

---

---

---

---

---

## Left-to-Right Proof

Claim:

In  $Z$ , the digits corresponding to clauses are 1, 2, or 3.

Reason:

$v_i$  has 1 in column  $C_j$  if  $x_i$  appears in  $C_j$ , and 0 otherwise.

$v'_i$  has 1 in column  $C_j$  if  $\neg x_i$  appears in  $C_j$ , and 0 otherwise.

Clause  $C_j$  has 3 variables.

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$v'_1$	1	0	0	0	1	1	0
$v'_2$	0	1	0	1	1	1	0
$v_3$	0	0	1	0	0	1	1
$Z$	1	1	1	1	2	3	1
$T$	1	1	1	4	4	4	4

---

---

---

---

---

---

---

---

## Left-to-Right Proof

How  $Z$  can be equal to  $T$ ?

– Use “filler” variables  $s_j$  to make  $Z$  equal to  $T$

• Until now

–  $Z = 1111231$

–  $T = 1114444$

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$v'_1$	1	0	0	0	1	1	0
$v'_2$	0	1	0	1	1	1	0
$v_3$	0	0	1	0	0	1	1
$Z$	1	1	1	1	2	3	1
$T$	1	1	1	4	4	4	4

---

---

---

---

---

---

---

---

## Left-to-Right Proof

- $s_j$  has 0 in digits from variables.
- $s_j$  has 1 or 2 in digits from clauses.
- We can add both  $s_j$  and  $s'_j$

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$s_1$	0	0	0	1	0	0	0
$s'_1$	0	0	0	2	0	0	0
$s_2$	0	0	0	0	1	0	0
$s'_2$	0	0	0	0	2	0	0
$s_3$	0	0	0	0	0	1	0
$s'_3$	0	0	0	0	0	2	0
$s_4$	0	0	0	0	0	0	1
$s'_4$	0	0	0	0	0	0	2

---

---

---

---

---

---

---

---

## Left-to-Right Proof

1. Add  $V_i$  to  $S'$  which are in the solution to  $\varphi$ .

2. Use filler variables

$S' = \{1000110, 101110, 10011, 1000, 2000, 200, 10, 1, 2\}$

$Z = T$

Q.E.D. (*quod erat demonstrandum*)

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$V_1$	1	0	0	0	1	1	0
$V_2$	0	1	0	1	1	1	0
$V_3$	0	0	1	0	0	1	1
$S_1$	0	0	0	1	0	0	0
$S'_1$	0	0	0	2	0	0	0
$S_2$	0	0	0	0	2	0	0
$S_3$	0	0	0	0	0	1	0
$S_4$	0	0	0	0	0	0	1
$S'_4$	0	0	0	0	0	0	2
$Z$	1	1	1	4	4	4	4
$T$	1	1	1	4	4	4	4

---

---

---

---

---

---

---

---

## Right-to-Left Proof

- Suppose there is a subset  $S' \subseteq S$  that sums to  $T$ .
  - $T$  is written as  $n$  1's followed by  $k$  4's
- Claim: There exists a truth-value assignment to  $x_i$  that satisfies  $\varphi$

---

---

---

---

---

---

---

---

Right-to-Left Proof

- The  $n$  most significant digits of  $T$  are 1 (remember  $T$  is 1111...4444).
- Thus subset  $S'$  includes either  $v_i$  or  $v'_i$  for  $i = 1, 2, \dots, n$

	$X_{i+1}$	$X_i$	$X_{i+1}$	$C_i$	$G$
$V_{i+1}$	1	0	0		
$V_{i+1}$	1	0	0		
$V_i$	0	1	0		
$V_i$	0	1	0		
$V_{i+1}$	0	0	1		
$V_{i+1}$	0	0	1		
$T$	1	1	1	4	4

---

---

---

---

---

---

---

---

Right-to-Left Proof

Truth-value assignment:

- if  $v_i \in S'$ 
  - $x_i = 1$
- If  $v'_i \in S'$ 
  - $x_i = 0$
- Claim:
  - This assignment satisfies  $\varphi$ .

---

---

---

---

---

---

---

---

Right-to-Left Proof

- In the  $k$  least significant digits of  $T$
- The “filler” variables sum up at most to 3
  - Thus, the digit corresponding to  $C_j$  in  $T$ , must include at least one  $v_i$  or  $v'_i$ .

	$x_1$	$x_2$	$x_3$	$C_1$	$C_2$	$C_3$	$C_4$
$s_1$	0	0	0	1	0	0	0
$s'_1$	0	0	0	2	0	0	0
$s_2$	0	0	0	0	1	0	0
$s'_2$	0	0	0	0	2	0	0
$s_3$	0	0	0	0	0	1	0
$s'_3$	0	0	0	0	0	2	0
$s_4$	0	0	0	0	0	0	1
$s'_4$	0	0	0	0	0	0	2
$T$	1	1	1	4	4	4	4

---

---

---

---

---

---

---

---

## Right-to-Left Proof

If  $v_i \in S^*$  then  
 $x_i = 1$  and  $C_j$  is satisfied since  
 $C_j = (\dots \vee x_i \vee \dots)$

	$x_{i-1}$	$x_i$	$x_{i+1}$	$C_{j-1}$	$C_j$	$C_{j+1}$
$v_i$	0	1	0	0	1	0
Filler	0	0	0	3	3	3
$T$	1	1	1	4	4	4

---

---

---

---

---

---

---

---

## Right-to-Left Proof

If  $v'_i \in S^*$  then  $x_i = 0$  and  $C_j$   
 is satisfied since  $C_j =$   
 $(\dots \vee \neg x_i \vee \dots)$   
 Q.E.D.

	$x_{i-1}$	$x_i$	$x_{i+1}$	$C_{j-1}$	$C_j$	$C_{j+1}$
$v'_i$	0	1	0	0	1	0
Filler	0	0	0	3	3	3
$T$	1	1	1	4	4	4

---

---

---

---

---

---

---

---

## Knapsack Problem

- 0-1 Knapsack optimization problem
  - Input
    - Capacity  $K$
    - $n$  items with weights  $w_i$  and values  $v_i$
  - Yes/No Question
    - Find a set of items  $S$  such that
      - the sum of weights of items in  $S$  is at most  $K$
      - the sum of values of items in  $S$  is maximized
- We gave a polynomial-time dynamic programming solution for this problem
- Show that Partition  $\leq_p$  Knapsack
- Is this a contradiction?

---

---

---

---

---

---

---

---

## Defining subproblems

- Define  $P(i, w)$  to be the problem of choosing a set of objects from the *first*  $i$  objects that maximizes value subject to weight constraint of  $w$ .
  - Impose an *arbitrary* ordering on the items
- $V(i, w)$  is the value of this set of items
- Original problem corresponds to  $V(n, K)$

---

---

---

---

---

---

---

## Recurrence Relation/Running Time

- $V(i, w) = \max (V(i-1, w-w_i) + v_i, V(i-1, w))$ 
  - A maximal solution for  $P(i, w)$  either
    - uses item  $i$  (first term in max)
    - or does NOT use item  $i$  (second term in max)
- $V(0, w) = 0$  (no items to choose from)
- $V(i, 0) = 0$  (no weight allowed)
- What is the running time of this solution?
  - Number of table entries:
  - Time to fill each entry:

---

---

---

---

---

---

---

## Example

$w_A = 2 \quad v_A = \$40$   
 $w_B = 3 \quad v_B = \$50$   
 $w_C = 1 \quad v_C = \$100$   
 $w_D = 5 \quad v_D = \$95$   
 $w_E = 3 \quad v_E = \$30$

		Items				
Weight		A	B	C	D	E
	1	\$0	\$0	\$100	\$100	\$100
	2	\$40	\$40	\$100	\$100	\$100
	3	\$40	\$50	\$140	\$140	\$140
	4	\$40	\$50	\$150	\$150	\$150
	5	\$40	\$90	\$150	\$150	\$150
	6	\$40	\$90	\$190	\$195	\$195
	7	\$40	\$90	\$190	\$195	\$195
	8	\$40	\$90	\$190	\$235	\$235
	9	\$40	\$90	\$190	\$245	\$245
	10	\$40	\$90	\$190	\$245	\$245

---

---

---

---

---

---

---

## Weak NP-completeness

- An NP-complete problem is called “weakly NP-complete” if it has in its description one or more integer parameters and the corresponding problem where these parameters are represented in unary is in P.
- An NP-complete problem is strongly NP-complete if the problem is still NP-complete even if integer parameters are encoded in unary

---

---

---

---

---

---

---

## Select the Right Source Problem

**3-SAT:** The old reliable. When none of the other problems seem to work, this is the one to come back to.

**Integer Partition:** A good choice for *number* problems.

**3-Partition:** A good choice for proving “*strong*” NP-completeness for *number* problems.

- *Strongly NP-complete:* A problem that remains NP-complete even if its numerical parameters are bounded by a polynomial in input size

**Vertex Cover:** A good choice for *selection* problems.

**Hamiltonian Path:** A good choice for *ordering* problems.

---

---

---

---

---

---

## Minimum Set Cover

Problem: Given a family  $F$  of subsets  $\{S_1, S_2, \dots, S_m\}$  of a universal set  $U = \{u_1, u_2, \dots, u_n\}$  and an integer  $k$ , is it possible to choose only  $k$  elements of  $F$  such that the union of these elements is  $U$ .

- NP membership?
  - given a subset of sets, we can count them, and show that all elements of  $U$  are included.
- NP-hardness?
  - What problem should we choose to reduce this time?

---

---

---

---

---

---

---

## State of Knowledge (assuming $P \neq NP$ )

If  $P \neq NP$  then  $NPI = NP - (P \cup NP\text{-complete}) \neq \emptyset$

NPI is the class of problems having intermediate complexity

---

---

---

---

---

---

---

## Class of NPI Problems

- Assuming  $P \neq NP$ 
  - Any language in NP that is not known to be in P and there is not NP-hardness proof for it yet
  - Certain problems that have withstood the test of time
    - Graph Isomorphism
    - Composite numbers
    - Linear programming

---

---

---

---

---

---

---

## GRAPH ISOMORPHISM (GI)

- INSTANCE: Graphs  $G=(V, E)$  and  $G'=(V, E')$
- DECISION:
  - Are G and G' isomorphic?
  - Is there a one-to-one function  $f: V \rightarrow V$  such that  $(u, v) \in E$  if and only if  $(f(u), f(v)) \in E'$ ?
- NP membership?
- NP-hardness?

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## SUB-GRAPH ISOMORPHISM (SGI)

- INSTANCE: Graphs  $G_1=(V_1, E_1)$  and  $G_2=(V_2, E_2)$
- DECISION:
  - Does  $G_1$  have a sub-graph isomorphic to  $G_2$ ?
- NP membership?
- NP-hardness?
  - CLIQUE is a special case of SGI!
  - Thus SGI is NP-hard!

---

---

---

---

---

---

---

## GRAPH ISOMORPHISM (GI)

- INSTANCE: Graphs  $G=(V, E)$  and  $G'=(V, E')$
- DECISION:
  - Are  $G$  and  $G'$  isomorphic?
  - Is there a one-to-one function  $f: V \rightarrow V$  such that  $(u, v) \in E$  if and only if  $(f(u), f(v)) \in E'$ ?
- After so many years, we do not yet know whether GI is in P or NP-complete.
- What is it about GI?

---

---

---

---

---

---

---

## GRAPH ISOMORPHISM (GI)

- GI is much more constrained than already known NP-complete problems
- When reducing a known problem to an unknown problem, we seem to need some redundancy in the target problem
- GI lacks such a redundancy!
  - For example, in SGI, adding new edges to  $G_1$  does not affect the fact that  $G_1$  includes (or does not include) a subgraph isomorphic to  $G_2$
  - We do not have such a leeway with GI!

---

---

---

---

---

---

---

## Complement Problems

- The complement of a problem is the problem with reverse answers to the decision problem
- E.g., what is the complement of SAT, CLIQUE, VERTEX COVER, etc.
- co-NP: class of all problems whose complement is in NP
- co-P: class of all problems whose complement is in P
- What is co-NP-complete?

---

---

---

---

---

---

---

## NP vs. co-NP

Conjecture:  $\text{co-NP} \neq \text{NP}$

If  $\text{co-NP} \neq \text{NP}$  then  $P \neq \text{NP}$

If the complement of an NP-complete problem is in NP, then  $\text{co-NP} = \text{NP}$ . Why?

---

---

---

---

---

---

---

## COMPOSITE NUMBERS

- INSTANCE: Positive integer  $K$
- DECISION:
  - Are there integers  $x$  and  $y$  such that  $K = x \cdot y$ ?
- What is the complement of COMPOSITE?
  - PRIMES
- Both are in NP!
- Unlikely that COMPOSITE is NP-complete!
- COMPOSITE was considered to be an NPI problem until 2002.
- In fact, now that we know PRIMES is in P, COMPOSITE is in P as well!

---

---

---

---

---

---

---

## Summary: Polynomial or Exponential?

<u>P</u>	<u>NP-Complete</u>
Shortest Path	Longest Path
Eulerian Circuit	Hamiltonian Cycle
Edge Cover	Vertex Cover

---

---

---

---

---

---

---
