

Chapter 5: Major Metabolic Pathways

David Shonnard
Department of Chemical Engineering
Michigan Technological University

Presentation Outline:

- 1 Introduction to Metabolism
- 1 Glucose Metabolism
 - Glycolysis, Krebs's Cycle, Respiration
- 1 Biosynthesis
- 1 Fermentation

Introduction

Metabolism is the collection of enzyme-catalyzed reactions that convert substrates that are external to the cell into various internal products.

Introduction: Metabolism, Genetic Engineering and Bioprocessing

Genetic Engineering allows for the alteration of metabolism by insertion or deletion of selected genes in a predetermined manner (Metabolic Engineering).

An understanding of metabolic pathways in the organism of interest is of primary importance in bioprocess development.

Characteristics of Metabolism

1. Varies from organisms to organism
2. Many common characteristics
3. Affected by environmental conditions
 - » a) O₂ availability: *Saccharomyces cerevisiae*
 - Aerobic growth on glucose → more yeast cells
 - Anaerobic growth on glucose → ethanol
 - » b) Control of metabolism is important in bioprocesses

Types of Metabolism

Catabolism

Metabolic reactions in the cell that degrade a substrate into smaller / simpler products.

Anabolism

Metabolic reactions that result in the synthesis of larger / more complex molecules.

Figure 5.1: Classes of Reactions (Fig. 5.1)

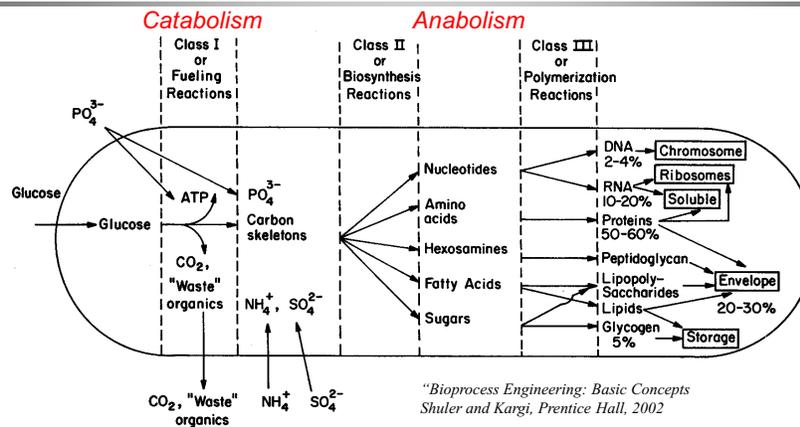

Figure 5.1. Schematic diagram of reactions in a bacterial cell.

David R. Shonnard

Michigan Technological University

7

Bioenergetics

The source of energy to fuel cellular metabolism is "reduced" forms of carbon (sugars, hydrocarbons, etc.)

The Sun is the ultimate source via the process of Photosynthesis in plants

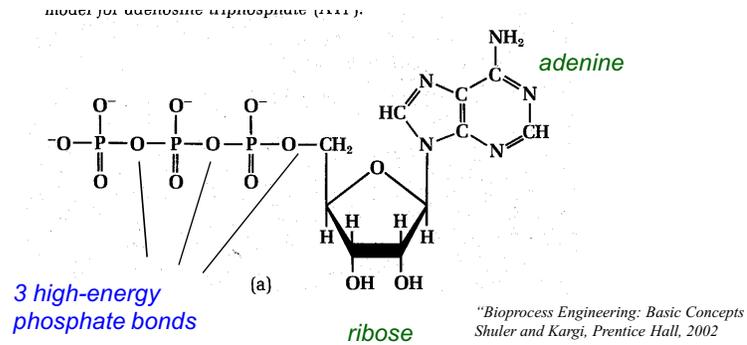

David R. Shonnard

Michigan Technological University

8

ATP - Adenosine Triphosphate

Catabolism of carbon-containing substrates generates high energy biomolecules

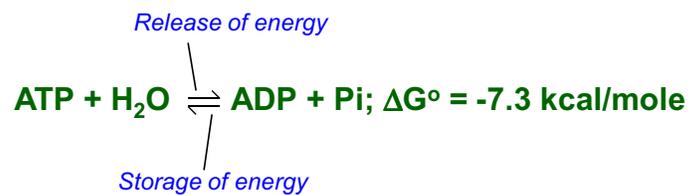

David R. Shonnard

Michigan Technological University

9

ATP - Reactions

Analogs of ATP

GTP = guanosine triphosphate

UTP = uridine triphosphate

CTP = cytidine triphosphate

David R. Shonnard

11

NAD⁺ and NADP⁺ (Fig. 5.3)

- Nucleotide derivatives that accept H^+ and e^- during oxidation / reduction reactions

- Transfer e^- to O_2 during respiration

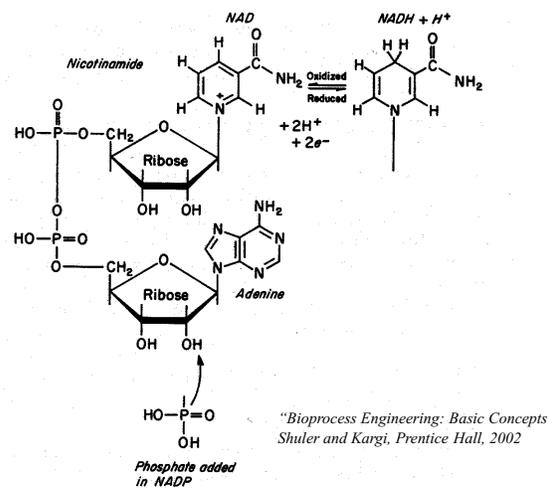

Figure 5.3. Structure of the oxidation-reduction enzyme nicotinamide adenine dinucleotide (NAD).

12

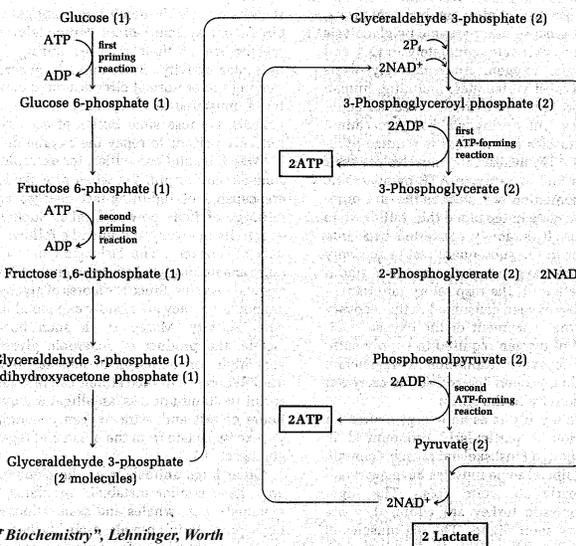

Glucose Metabolism: Catabolic Pathways of Primary Importance

1. Glycolysis: from glucose to pyruvate.
2. Krebs or tricarboxylic acid (TCA) cycle for conversion of pyruvate to CO_2 .
3. Respiration or *electron transport chain* for formation of ATP by transferring electrons from NADH to an electron acceptor (O_2 under aerobic conditions).

Glycolysis: Embden- Meyerhof- Parnas (EMP) Pathway

Phase 1: Phosphorylation of glucose and its conversion to glyceraldehyde 3-phosphate

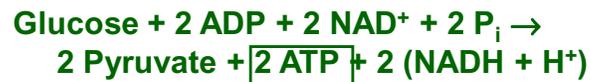

Phase 2: Conversion of glyceraldehyde 3-phosphate to lactate and the coupled formation of ATP

"Principles of Biochemistry", Lehninger, Worth

Glycolysis: in Eucaryotes

- *Fermentation of Glucose* → *Pyruvate*
- *no O₂ required*
- *Occurs in the Cytoplasm*

In Eucaryotes, Cytoplasm ↓ to Mitochondria

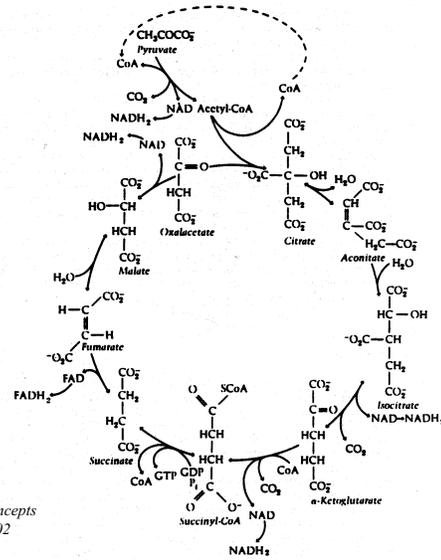

Krebs or TCA Cycle

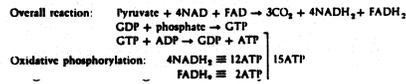

- In Mitochondria of eucaryotes
- provides e⁻ (NADH) and ultimately energy (ATP) for biosynthesis
- provides intermediates for amino acid synthesis
- generates energy (GTP)

Krebs or TCA Cycle

(Fig. 5.5)

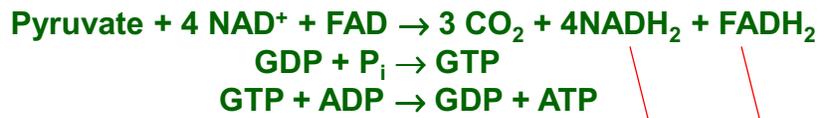

"Bioprocess Engineering: Basic Concepts
Shuler and Kargi, Prentice Hall, 2002

David R. Shonnard

17

Krebs or TCA Cycle

Yield of ATP

1 + 4(3) + 2 = 15 ATP

David R. Shonnard

Michigan Technological University

18

Complete Oxidation of Glucose

$$\Delta G^\circ = (36)(7.3 \text{ kcal/mole}) = 263 \text{ kcal/mole glucose}$$

Energetics of Glucose Oxidation

Direct Oxidation of Glucose

$$\Delta G^\circ = 686 \text{ kcal/mole glucose}$$

Energy Efficiency of Glycolysis/TCA Cycle

$$\frac{263}{686}(100) = 38\% \text{ (standard conditions)}$$
$$\approx 60\% \text{ (nonstandard conditions)}$$

ATP Yields

Eucaryotes

$$\frac{3 \text{ ATP}}{\text{NADH}} \quad \frac{2 \text{ ATP}}{\text{FADH}} \quad \rightarrow \quad \frac{36 \text{ ATP}}{\text{Glucose}}$$

Procaryotes

$$\frac{2 \text{ ATP}}{\text{NADH}} \quad \frac{1 \text{ ATP}}{\text{FADH}} \quad \rightarrow \quad \frac{24 \text{ ATP}}{\text{Glucose}}$$

Respiration

- In Mitochondria of eucaryotes
- in membrane-bound proteins in procaryotes
- e⁻ transport from NADH or FADH to an electron acceptor

Aerobic
O₂

Anaerobic
NO₃⁻, SO₄²⁻, Fe³⁺, Cu²⁺, S⁰,

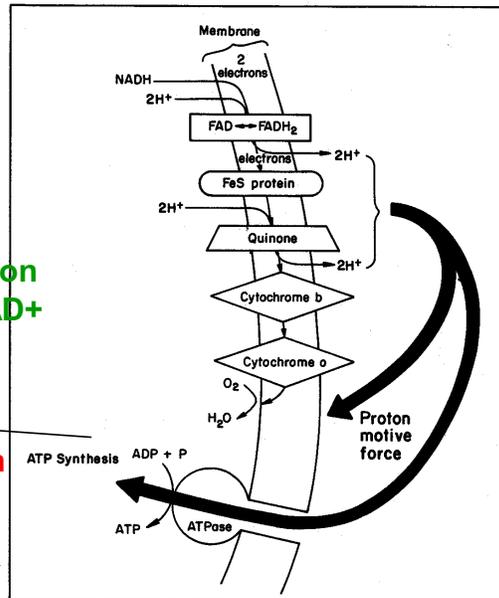

Respiration

(Fig. 5.6)

Goals of Respiration
1. Regenerate NAD⁺
2. Generate ATP

Oxidative Phosphorylation

*"Bioprocess Engineering: Basic Concepts
Shuler and Kargi, Prentice Hall, 2002*

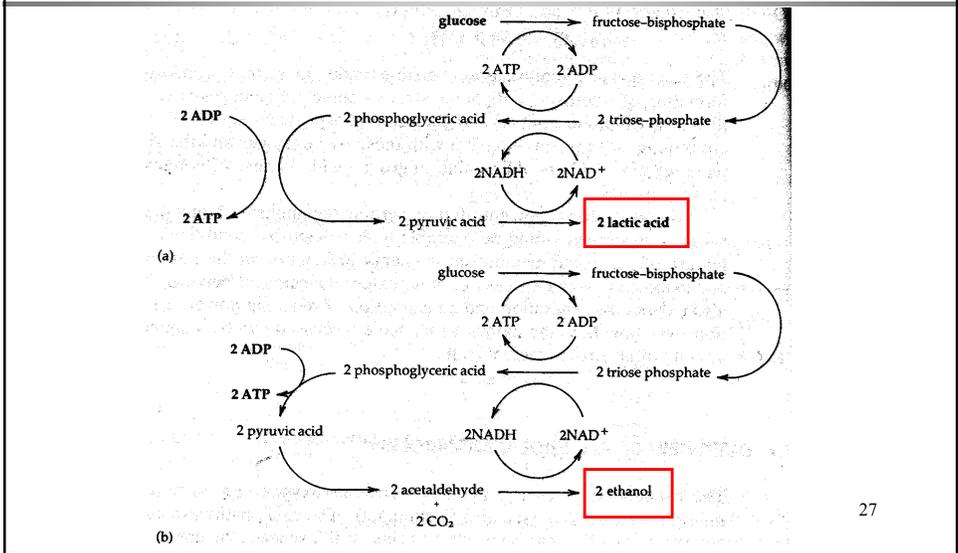

David R. Shonnard **Figure 5.6.** Electron transport and electron transport phosphorylation. Top: Ox 23
Michigan Technological University

Biosynthesis

The EMP pathway and TCA cycle are used for catabolism (Glucose → CO₂ + NADH + ATP) primarily. → energy production.

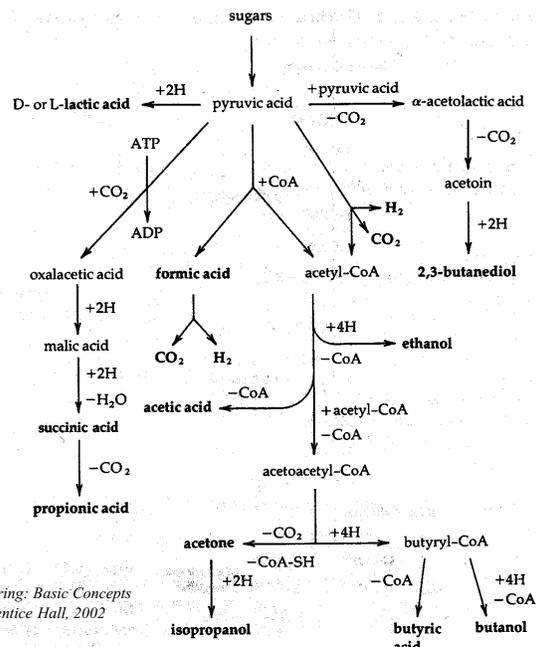

- The Hexose - Monophosphate pathway (HMP) is used for biosynthesis

Fermentation: No TCA Cycle or Respiration

27

Products from Fermentation

28

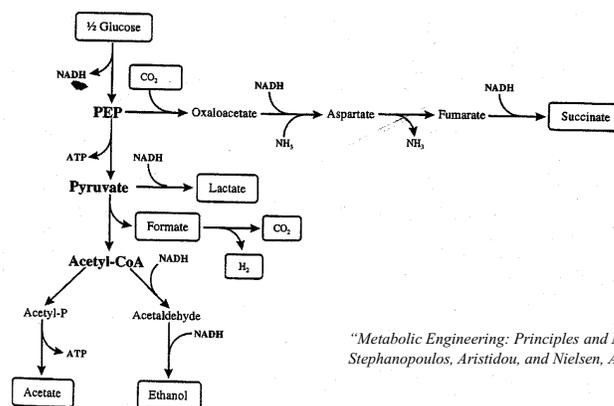

Metabolic Engineering (ME)

“the directed improvement of product formation or cellular properties through the modification of specific biochemical reactions(s) or the introduction of new one(s) with the use of recombinant DNA technology”.

It is a field that employs the following skills
+ Applied molecular biology
+ Reaction Engineering
+ Systems analysis

*“Metabolic Engineering: Principles and Methodologies”
Stephanopoulos, Aristidou, and Nielsen, Academic Press, 1998*

Metabolic Pathway Analysis

*“Metabolic Engineering: Principles and Methodologies”
Stephanopoulos, Aristidou, and Nielsen, Academic Press, 1998*

FIGURE 3.1 Mixed acid fermentation by *E. coli*. The substrate (glucose) and the seven metabolic products are circled. Intracellular metabolites and cofactors included in the metabolic model are marked in boldface type. The transamination reaction where aspartate is formed from oxaloacetate is shown as a direct amination, i.e., glutamate and 2-ketoglutarate are not shown in order to reduce the complexity.

Principles of ME and Mixed Acid Fermentation

1. Rates of intra-cellular reactions can be measured by extra-cellular product accumulation. (ATP)
2. The redox balance (balance on NADH consumption and generation) must balance.

TABLE 3.1 Typical Yields of the Mixed Acid *E. coli* Fermentation^a

Metabolic product	Moles formed per 100 mol of glucose fermented
Formate	2.4
Acetate	36.5
Lactate	79.5
Succinate	10.7
Ethanol	49.8
CO ₂	88.0
H ₂	75.0

^a The data are taken from Ingraham *et al.* (1983).

31

Analysis of *E. Coli* Mixed Acid Fermentation

1. Using a basis of 100 moles of Glucose, how many moles of NADH are generated?
2. Using the data in Table 3.1, how many moles of NADH are consumed?
3. Is a redox balance achieved during this fermentation?

"Metabolic Engineering: Principles and Methodologies"
Stephanopoulos, Aristidou, and Nielsen, Academic Press, 1998

David R. Shonnard Michigan Technological University

32

Analysis of E. Coli Mixed Acid Fermentation

1. Using a basis of 100 moles of Glucose, how many moles of NADH are generated?

$$2 (10.7) + 79.5 + 2 (49.8) = 200.5 \text{ moles NADH consumed}$$

2. Using the data in Table 3.1, how many moles of NADH are consumed?

$$1 (2 \times 100) = 200 \text{ moles NADH generated}$$

3. Is a redox balance achieved during this fermentation?

Yes
