X-component } Navier Stokes (NS):  
} Egn of Motion (EOM) ③

$$0 = -\frac{\partial P}{\partial X} + \rho g s \sin \beta$$

$$\boxed{\frac{\partial P}{\partial X} = \rho g s \sin \beta}$$

Y-component } NS:

$$0 = -\frac{\partial P}{\partial Y}$$

$\Rightarrow$  P does  
not depend  
on y

$z$ -component of NS:

(x)

$$0 = -\frac{\partial P}{\partial z} + \rho \frac{\partial^2 V_z}{\partial x^2} + \rho g \cos \beta$$

does  $P$  vary in  $z$ -dir?

$$z=0 \quad P=P_{atm}$$

$$z=L \quad P=P_{atm}$$

$$z=\text{anything} \quad P=P_{atm}$$

$\left. \frac{\partial P}{\partial z} \right|_{\text{atm}}$

$$\Rightarrow \frac{\partial P}{\partial z} = 0 //$$

Now the eqn becomes:

$$0 = \mu \frac{d^2 V_z}{dx^2} + \rho g \cos \beta$$

$$\underline{V} = \begin{pmatrix} 0 \\ 0 \\ V_z \end{pmatrix} \quad V_z(x) \text{ only}$$

$$0 = \mu \frac{d^2 V_z}{dx^2} + \rho g \cos \beta$$

Solve:

$$\frac{d^2 V_z}{dx^2} = \frac{-\rho g \cos \beta}{\mu}$$

$$\frac{d}{dx} \left( \frac{dV_z}{dx} \right) = -\left( \frac{-\rho g \cos \beta}{r} \right) = C$$

$\equiv \Phi$

$$\frac{d\Phi}{dx} = C$$

} use substitution  
to make clear  
what integration  
is needed

$$\frac{dV_z}{dx} = \Phi = Cx + C_1$$

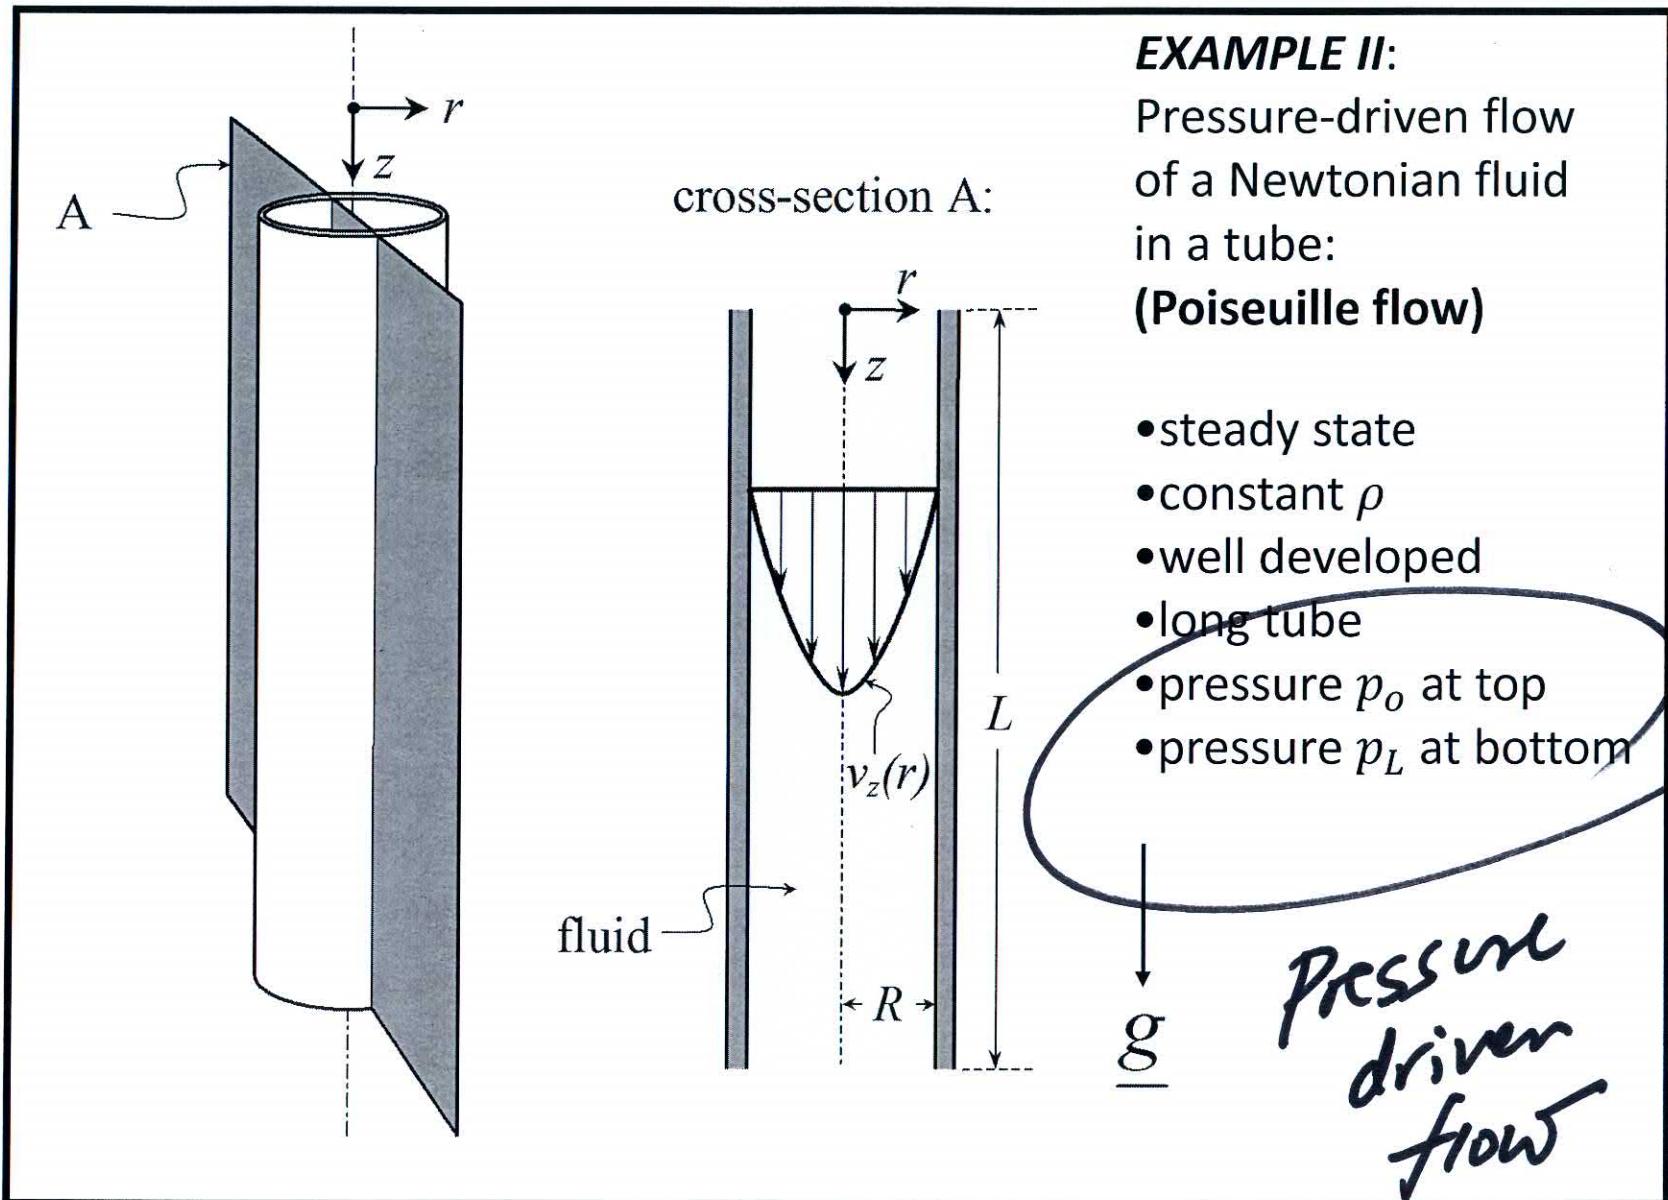

$$\frac{dV_z}{dx} = Cx + C_1$$

— continue  
as  
before.

$$V_z = \frac{Cx^2}{2} + C_1 x + C_2$$

Note: the  $r$ -component of the Navier-Stokes equation in spherical coordinates may be simplified by adding  $0 = \frac{2}{r} \nabla \cdot \underline{v}$  to the component shown above. This term is zero due to the continuity equation (mass conservation). See Bird et. al.

Note: the  $r$ -component of the Navier-Stokes equation in spherical coordinates may be simplified by adding  $0 = \frac{2}{r} \nabla \cdot \underline{v}$  to the component shown above. This term is zero due to the continuity equation (mass conservation). See Bird et. al.
