

Parallel Algorithms HW 3

Boring test of scripting and qsub.

1. Create a copy of the Gowtham's script to run the device query in a directory labelled HW3. Run it in the HW3 directory and check it works. Report what it says and what compute node it ran on.
2. Save the script from Q1 as HW3 and modify it to run the matrixMul executable from the same directory as the deviceQuery. Make sure you change all the things you need to.
