

## Calculations of Flow Rate in a Pipeline

( based on Cutlip and Shacham, 2008, pp. 110-118 )

### I. Working Equations

The mechanical energy balance is given by

$$-\frac{1}{2}v^2 + g\Delta z + \frac{g_c\Delta P}{\rho} + 2\frac{f_F L}{D}v^2 = 0 \quad (1)$$

where the Fanning friction factor is given by:

$$f_F = \begin{cases} \frac{16}{Re} & \text{if } Re < 2100 \\ \frac{1}{16} \left( \log \left[ \frac{\epsilon}{3.7} - \frac{5.02}{Re} \log \left( \frac{\epsilon}{3.7} + \frac{14.5}{Re} \right) \right] \right)^{-2} & \text{if } Re > 2100 \end{cases} \quad (2)$$

and Reynold's number is given by

$$Re = \frac{\rho v D}{\mu} \quad (3)$$

We will use successive substitution to solve for the velocity  $v$  using the following rearrangement of equation (1):

$$v = \sqrt{\frac{g\Delta z + \frac{g_c\Delta P}{\rho}}{\frac{1}{2} - 2\frac{f_F L}{D}}} \quad (4)$$

In addition, we will use the following correlation for the density and viscosity of water:

$$\rho = 62.122 + 0.0122T - 1.54 \times 10^{-4}T^2 + 2.65 \times 10^{-7}T^3 - 2.24 \times 10^{-10}T^4 \quad (5)$$

$$\mu = \exp\left(-11.0318 + \frac{1057.51}{T + 214.624}\right) \quad (6)$$

where  $T$  is in  $^{\circ}F$ ,  $\rho$  is in  $\frac{lb_m}{ft^3}$  and  $\mu$  is in  $\frac{lb_m}{ft \cdot s}$ .

### II. Additional Data:

$\epsilon$ (surface roughness)	0.00015 $ft$ (for steel pipes)	
$D$ (inside diameter)	4.026 $in$	4" Sch 40
	5.047 $in$	5" Sch 40
	6.065 $in$	6" Sch 40
	7.981 $in$	8" Sch 40

### III. Problem Statement

- Obtain the velocity in  $ft/s$  for:  $T = 60^\circ F$ ,  $\Delta P = -150 \text{ psi}$ ,  $\Delta z = 300 \text{ ft}$ ,  $L = 1000 \text{ ft}$ , and 8" diameter Sch 40 commercial steel pipe, using successive substitution.
- Calculate the flow velocities in  $ft/s$  for  $L = 500, 1000, \dots, 10,000 \text{ ft}$  for different Sch 40 commercial steel pipes of nominal diameters: 4", 5", 6" and 8".

### IV. Solution

- Fill-in the spreadsheet such as the one in Figure 1.

	A	B	C	D	E	F	G	H
1								
2	<b>Velocity in Pipeline</b>							
3								
4	<b>Data</b>	T			deg F			
5		eps			ft		eps/D	
6		D			in			
7		dP			psi			
8		dz			ft			
9		L			ft			
10								
11	<b>props</b>	rho			lb/ft <sup>3</sup>			
12		mu			lb/(ft s)			
13								
14	<b>constants</b>	gc		32.174	lbm ft/(lbf s <sup>2</sup> )			
15		g		32.174	ft/s <sup>2</sup>			
16								

Figure 1. Sample setup

then build the columns for successive substitution as in Figure 2.

	A	B	C	D	E	F	G	H
17		<b>Successive substitution:</b>						
18								
19			Iteration	Re	fric factor	v_k	v_k+1	err
20			0					
21			1					
22		eqn 3	2					
23			3					
24		eqn 2	4					
25			5					
26			6					
27			7					
28			8					
29			9					
30			10					
31								

Figure 2. Successive substitution table.

- b) Build a data table by referring to address of converged value for velocity but varying the value of  $L$  and  $D$ .
