|------------------------|----------------------------|----------------------|-------------------|-------------------------------------|----------------|
| Partition | s | | | | |

Definition

 A partition of n, denoted λ ⊢ n, is a non-increasing sequence of positive integers summing to n,

L

$$=(\lambda_1,\ldots,\lambda_k)$$
 $\sum_{i=1}^n \lambda_i = n$

• The partition function is $p(n) := \#\{\lambda \vdash n\}$.

Example

We have p(4) = 5 since

4 = 3 + 1 = 2 + 2 = 2 + 1 + 1 = 1 + 1 + 1 + 1.

Understanding $\psi_{k,t}$ 00000 Wrap-Up 000

Glaisher's Theorem

Proposition (Glaisher's Theorem)

The number of k-regular partitions and the number of k-indivisible partitions of n are equal.

Proof.

$$\prod_{n=1}^\infty (1+q^n+\dots+q^{(k-1)n}) = \prod_{n=1}^\infty rac{1-q^{kn}}{1-q^n}.$$

Remark

The literature often *conflates* k-regular and k-indivisible partitions. *However, the parts in these partitions are different.*

To find asymptotic for a(n), study its generating function

$$F(q)=\sum_{n=0}^{\infty}a(n)q^{n}.$$

We can get back a(n) by integrating around the origin as

$$\frac{1}{2\pi i}\int_{\mathcal{C}}\frac{F(q)}{q^{n+1}}\,\mathrm{d}q=a(n).$$

Question

How do we estimate the integral?

Euler-Maclaurin Asymptotics with a Pole

Proposition (Bringmann, Craig, Males, Ono)

Let $0 < a \leq 1$, let

$$f(z)\sim \sum_{n=-1}^{\infty}c_nz^n,$$

and suppose its derivatives are of sufficient decay as $z
ightarrow \infty$, then

$$\sum_{n=0}^{\infty} f((n+a)z) \sim \frac{l_f^*}{z} - \frac{c_{-1}}{z} \left(\log(z) + \psi(a) + \gamma\right) - \sum_{n=0}^{\infty} c_n \frac{B_{n+1}(a)}{n+1} z^n$$

as $z \rightarrow 0$, where

$$J_f^* \coloneqq \int_0^\infty \left(f(u) - \frac{c_{-1}e^{-u}}{u} \right) \mathrm{d}u,$$

 ψ is the digamma fnc., and γ is the Euler-Mascheroni constant.

Proving One Pattern

Proposition (J.-O.)

Let $k, t \ge 2$ be coprime, and suppose that $k \ge y(y+1)$. Then, if $1 \le r \le y \le t$ and $r < s \le t$, we have that $r \succ_{k,t} s$.

Proof Outline.

- Rewrite as $\psi\left(\frac{s}{t}\right) \psi\left(\frac{r}{t}\right) > \frac{1}{k}\left(\psi\left(\frac{\bar{s}}{t}\right) \psi\left(\frac{\bar{r}}{t}\right)\right)$.
- Minimize the left hand side and maximize the right hand side

$$\psi\left(rac{y+1}{t}
ight)-\psi\left(rac{y}{t}
ight)>rac{1}{k}\left(\psi(1)-\psi\left(rac{1}{t}
ight)
ight)$$

• Apply the previous two lemmas and rearrange.

Summary of Methods

Idea

- Want: Asymptotics for parts lying in residue classes.
- Use the circle method. How do we estimate?
 - Modular Transformation Laws.
 - Euler-Maclaurin Summation when you're not so lucky.
- $\psi_{k,t}$ is intricate. How do we understand it?
 - Approximate with a square sum.
 - Make the weighting factor $\frac{1}{k}$ so small it washes everything out.
 - Fix $k \mod t$ (i.e., k = mt 1).

Summary of Results

Theorem (J.-O.)

Asymptotics for parts in k-regular/k-indivisible partitions of n which are r mod t (notationally, $D_k(r, t; n), D_k^{\times}(r, t; n)$).

Corollary (J.-O.)

• Bias towards lower congruence classes for $D_k(r, t; n)$.

• Intricate Bias for $D_k^{\times}(r, t; n)$.

Theorem (J.-O.)

Basic properties of the biases in $D_k^{\times}(r, t; n)$
