# Palindrome Partitions and Calkin-Wilf Tree 

Karlee Westrem<br>Michigan Technological University

Partition Theory Seminar<br>February 15, 2024<br>*This is joint work with my advisor David Hemmer

## Background Information

In number theory, the Calkin-Wilf tree is a tree in which the vertices correspond one-to-one to the positive rational numbers. The tree is rooted at the number 1 , and any rational number expressed in simplest terms as the fraction $\frac{a}{b}$ has as its two children the numbers $\frac{a}{a+b}$ (move to the left) and $\frac{a+b}{b}$. (move to the right)

## Background Information

## Background Information

## Partition Theory

Recall that $\lambda=\left(\lambda_{1}, \lambda_{2}, \ldots, \lambda_{r}\right)$ is a partition of $n$, denoted $\lambda \vdash n$, if $\lambda_{1} \geq \lambda_{2} \cdots \geq \lambda_{r}>0$ are positive integers with $\sum_{i=1}^{r} \lambda_{i}=n$.
$\lambda=(5,5,3,3,1)$ is a partition of $n=17$.

To $\lambda$ we associate its Young diagram [ $\lambda$ ].

## Partition Sequences

We start in the southwest corner of the diagram labeling a move to the right by 1 and a move upward by 0 .

## Partition Sequences

We start in the southwest corner of the diagram labeling a move to the right by 1 and a move upward by 0 . So every integer partition is associated with a sequence beginning with a 1 and ending with a 0 .

## Partition Sequences

We start in the southwest corner of the diagram labeling a move to the right by 1 and a move upward by 0 . So every integer partition is associated with a sequence beginning with a 1 and ending with a 0 .

## Partition Sequences

We start in the southwest corner of the diagram labeling a move to the right by 1 and a move upward by 0 . So every integer partition is associated with a sequence beginning with a 1 and ending with a 0 .

For what partitions of $n$ is the corresponding binary sequence a palindrome? How many are there for each $n$ ?

## Palindrome Sequences

## Definition

Let $P P(n)$ be the number of palindrome sequences whose corresponding integer partition is a partition of $n$.

| $n$ | $P P(n)$ | $n$ | $P P(n)$ | $n$ | $P P(n)$ | $n$ | $P P(n)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 11 | 10 | 21 | 12 | 31 | 38 |
| 2 | 2 | 12 | 2 | 22 | 2 | 32 | 34 |
| 3 | 2 | 13 | 8 | 23 | 36 | 33 | 18 |
| 4 | 2 | 14 | 10 | 24 | 12 | 34 | 46 |
| 5 | 4 | 15 | 10 | 25 | 14 | 35 | 104 |
| 6 | 2 | 16 | 2 | 26 | 24 | 36 | 2 |
| 7 | 4 | 17 | 18 | 27 | 36 | 37 | 20 |

## Palindrome Partitions

## Theorem

The number $P P(n)=2$ if and only if $n=3$ or $n+1$ is prime.
Which the two palindrome sequences are all zeros and all ones corresponding to ( $1^{n}$ ) and ( $n$ ) respectively.

## Palindrome Partitions

Q: How do we calculate the number of palindromes for $n$ ?

We have one of three cases, an odd \# of 1's, an odd \# of 0's, or both \# of 1 's and 0 's is even. Given a palindrome sequence of $n$, swapping a "01" in one spot means swapping a "10" in another spot.

## Palindrome Partitions

Q: If $n \neq 3$ or $n+1$ is not prime, how do we calculate the number of palindromes for $n$ ?

We have one of three cases, an odd number of 1 's, an odd number of 0 's, or an even number of 1 's and 0 's. Given a palindrome sequence of $n$, swapping a " 01 " in one spot means swapping a "10" in another spot.

## Palindrome Partitions

Q: If $n \neq 3$ or $n+1$ is not prime, how do we calculate the number of palindromes for $n$ ?

We have one of three cases, an odd number of 1 's, an odd number of 0 's, or an even number of 1 's and 0 's. Given a palindrome sequence of $n$, swapping a " 01 " in one spot means swapping a " 10 " in another spot.

## Palindrome Partitions

Q: If $n \neq 3$ or $n+1$ is not prime, how do we calculate the number of palindromes for $n$ ?

We have one of three cases, an odd number of 1 's, an odd number of 0 's, or an even number of 1 's and 0 's. Given a palindrome sequence of $n$, swapping a " 01 " in one spot means swapping a " 10 " in another spot.

## Palindrome Partitions

Q: How do we calculate the number of palindromes for $n$ ?

We have one of three cases, an odd number of 1 's, an odd number of 0 's, or an even number of 1 's and 0 's. Given a palindrome sequence of $n$, swapping a " 01 " in one spot means swapping a " 10 " in another spot.

## Palindrome Partitions

We have one of three cases, an odd number of 1 's, an odd number of 0 's, or an even number of 1 's and 0 's.
Case 3: we can will assume that the palindrome sequence looks like

$n=2 k I+I+1+I+2 k \quad$ and $2(n+1)=(2 k+2)(2 I+2)$

## Palindrome Partitions

| Case | $\lambda_{1}^{\prime}-1=\# 0$ 's | $\lambda_{1}-1=\# 1$ 's | $2(\mathrm{n}+1)$ |
| :---: | :---: | :---: | :---: |
| 1 | $2 \mathrm{k}+1$ | 2 l | $(2 \mathrm{l}+2)(2 \mathrm{k}+3)$ |
| 2. | 2 k | $2 \mathrm{l}+1$ | $(2 \mathrm{k}+2)(2 \mathrm{l}+3)$ |
| 3. | 2 k | 2 l | $(2 \mathrm{k}+2)(2 \mathrm{l}+2)$ |

If $n+1=p$ is prime, then solving for $k, /$ for each case, we find that the only solutions are when $k=0, I=(p-3) / 2$ and $k=(p-3) / 2, I=0$.

## Palindrome Partitions

$$
\text { Table: Palindrome partitions of } n=11
$$

| $\lambda$ | 11 | 7,4 | $5^{2}, 1$ | $5,4,2$ | $5,3^{2}$ | $3^{3}, 1^{2}$ | $3^{2}, 2^{2}, 1$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sequence | $1^{10}$ | $1^{3} 01^{3}$ | $01^{4} 0$ | 101101 | 110011 | 001100 | 010010 |
| length | 10 | 7 | 6 | 6 | 6 | 6 | 6 |

| $\lambda$ | $3,2^{4}$ | $2^{4}, 1^{3}$ | $1^{11}$ |
| :---: | :---: | :---: | :---: |
| Sequence | $10^{4} 1$ | $0^{3} 10^{3}$ | $0^{10}$ |
| length | 6 | 7 | 10 |

We only have 3 possible lengths.

## Definition

Let $P L(n)$ be the number of lengths among all sequences as $\lambda$ runs over all palindrome partitions of $n$. This is also the number of distinct perimeters among all palindrome partitions of $n$.

## Palindrome Partitions

## Theorem

$P L(n)$ is the number of factorizations $x y=2(n+1)$ where $0<x \leq y \leq n$. This is the sequence https: // oeis. org/A211270 shifted by one. Moreover, suppose there is a palindrome partition $\lambda \vdash n$ with the palindrome sequence having length $m=a+b$ with a zeros and $b$ ones. Then any other palindrome partition $\mu \vdash n$ with palindrome sequence of length $m$ must have a zeros and $b$ ones or $b$ zeros and $a$ ones.

If $n=11$, then $2(n+1)=24$, which has 3 factorizations namely, $2 \cdot 12,3 \cdot 8$, and $4 \cdot 6$.

We will use the factorizations of $2(n+1)$ to find all palindrome partitions for the given $n$.

## Palindrome Partitions for $\mathrm{n}=29$

$$
2(n+1)=60=x \cdot y
$$

## Palindrome Partitions for $\mathrm{n}=29$

$$
2(n+1)=60=x \cdot y
$$

| :---: | :---: | :---: | :---: | :---: |
| $2 \cdot 30$ | 0 | 28 | 1 | $(29)$ |
| $2 \cdot 30$ | 28 | 0 | 1 | $\left(1^{29}\right)$ |
| $3 \cdot 20$ | 1 | 18 | 1 | $(19,10)$ |
| $3 \cdot 20$ | 18 | 1 | 1 | $\left(2^{10}, 1^{9}\right)$ |
| $4 \cdot 15$ | 2 | 13 | $\left(\begin{array}{l}(7)\end{array}\right.$ | $(14,14,1)$ |
| $4 \cdot 15$ | 13 | 2 | $\binom{1}{1}$ | $\left(3,2^{13}\right)$ |
| $5 \cdot 12$ | 3 | 10 | $\binom{6}{1}$ | $(11,11,6,1)$ |
| $5 \cdot 12$ | 10 | 3 | $\binom{6}{1}$ | $\left(4,3^{5} 2^{5}\right)$ |
| $6 \cdot 10$ | 4 | 8 | $\binom{6}{2}$ | $\left(9^{3}, 1,1\right)$ |
| $6 \cdot 10$ | 8 | 4 | $\binom{6}{2}$ | $\left(5^{5}, 1^{4}\right)$ |

## Palindrome Partitions

## Theorem

We have the following generating function:

$$
\begin{gathered}
\sum_{n=0}^{\infty} P P(n) q^{n} \\
=\sum_{k=0}^{\infty} \sum_{l=0}^{\infty}\binom{k+\prime}{k} q^{2 k l+2 k+2 l+1}+2 \sum_{k=0}^{\infty} \sum_{l=0}^{\infty}\binom{k+\prime}{k} q^{2 k l+2 k+3 l+2} .
\end{gathered}
$$

## Palindrome Partitions

James Sellers provided this simplification to the last theorem using the binomial series $\frac{1}{(1-x)^{n+1}}=\sum_{j=0}^{\infty}\binom{n+j}{j} x^{j}$.

Theorem

$$
\sum_{n=0}^{\infty} P P(n) q^{n}=\sum_{k=0}^{\infty} \frac{q^{2 k+1}}{\left(1-q^{2 k+2}\right)^{k+1}}+2 \frac{q^{2 k+2}}{\left(1-q^{2 k+3}\right)^{k+1}}
$$

## Conjugating inner Young diagram

Consider $\lambda$ with sequence $B(\lambda)$ that has $A$ zeros and $B$ ones. Consider the boxes not in the first row or column as a partition $\tilde{\lambda}$ sitting inside an $A \times B$ rectangle. We will replace $\tilde{\lambda}$ with the partition obtained by taking its complement inside the $A \times B$ rectangle and rotating it 180 degrees, while preserving the first row and column of $\lambda$. Then the new diagram will be called $P\left(B(\lambda)^{r}\right)$.

## Conjugating inner Young diagram

Consider $\lambda$ with sequence $B(\lambda)$ that has $A$ zeros and $B$ ones. Consider the boxes not in the first row or column as a partition $\tilde{\lambda}$ sitting inside an $A \times B$ rectangle. We will replace $\tilde{\lambda}$ with the partition obtained by taking its complement inside the $A \times B$ rectangle and rotating it 180 degrees, while preserving the first row and column of $\lambda$. Then the new diagram will be called $P\left(B(\lambda)^{r}\right)$.

Let $R(n)$ be the number of partitions $\lambda \vdash n$ where $P\left(B(\lambda)^{r}\right) \vdash n$.

## Partitions with weight fixed by reversal

We require that it fill exactly half of the boxes in the $2 k \times 2 /$ or $(2 k+1) \times 2 /$ rectangle. Recall that the $q$-binomial coefficient $\left[\begin{array}{l}n \\ k\end{array}\right]_{q}$ is the generating function for partitions that fit inside an $(n-k) \times k$ rectangle, and is called a Gaussian polynomial. The coefficient of $q^{m}$ counts partitions of $m$ fitting inside a $(n-k) \times k$ rectangle, so it has leading term $q^{k(n-k)}$.

## Partitions with weight fixed by reversal

## Definition

Let $T(n, k)$ be the number of nondecreasing sequences of length n , with integer entries in $[-k, k$ ], summing to zero.

For example if $n=5$ and $k=4$ a possible sequence would be $\{-4,-2,1,1,4\}$. The array $T(n, k)$ is given as sequence A183917 in the OEIS.

## Proposition

The coefficient of $q^{k l}$ in the Gaussian polynomial $\left[\begin{array}{c}2 k+\prime \\ l\end{array}\right]_{q}$ is $T(I, k)$.
We give a bijection $\lambda=\left(\lambda_{1}, \lambda_{2}, \ldots, \lambda_{l}\right) \vdash k l$ to the corresponding sequence $\left\{\lambda_{I}-k, \lambda_{I-1}-k, \ldots, \lambda_{1}-k\right\}$.

## Partitions with weight fixed by reversal

## Theorem

We have the following generating function:

$$
\begin{gathered}
\sum_{n=0}^{\infty} R(n) q^{n} \\
=\sum_{k=0}^{\infty} \sum_{l=0}^{\infty} T(2 l, k) q^{2 k l+2 k+2 l+1}+2 \sum_{k=0}^{\infty} \sum_{l=0}^{\infty} T(k+1, l) q^{2 k l+2 k+3 l+2} .
\end{gathered}
$$

## Future research

## Problem

Can we write the generating functions for $R(n)$ in a more compact form $\sum f(n) q^{n}$ similar to the generating function for $P P(n)$ ? Can we see clearly from the generating function why $f(n)=2$ when $n+1$ is prime?

## Problem

The traditional Young's lattice has all partitions of $n$ in row $n$ with edges corresponding to removing and/or adding a single box. Classically this describes the branching of irreducible representations of the symmetric group. Does the branching diagram have any representation-theoretic interpretation?

## Future research

## Problem

Can we determine if a fraction in the Calkin-Wilf tree corresponds to a palindrome without doing the continued fraction expansion?

## Thank you

And a big thanks to Dave, as well as Matthew Just and Robert Schneider for suggesting looking at this operation on partitions and William Keith for help with generating functions. Also, a thanks to James Sellers for calculating the simplification of the generating function for $P P(n)$.
